

Email Client Testing Report

Roble Appliance Repair Email Campaign

Student: Alwin Ray Roble

Course: COMP 584

Website: <https://alwinray37.github.io/comp584-project1/>

Repository: <https://github.com/Alwinray37/comp584-project1>

1. Project Overview

This project is a promotional email for Roble Appliance Repair. It includes service information, images, contact buttons, an interactive FAQ, and responsive layouts for desktop and mobile devices.

2. Testing

The email was tested to check:

- Layout and responsiveness
- Images
- FAQ interaction
- Animation
- Call and email links

Testing Tool: MailViewr: <https://www.mailviewr.com/>

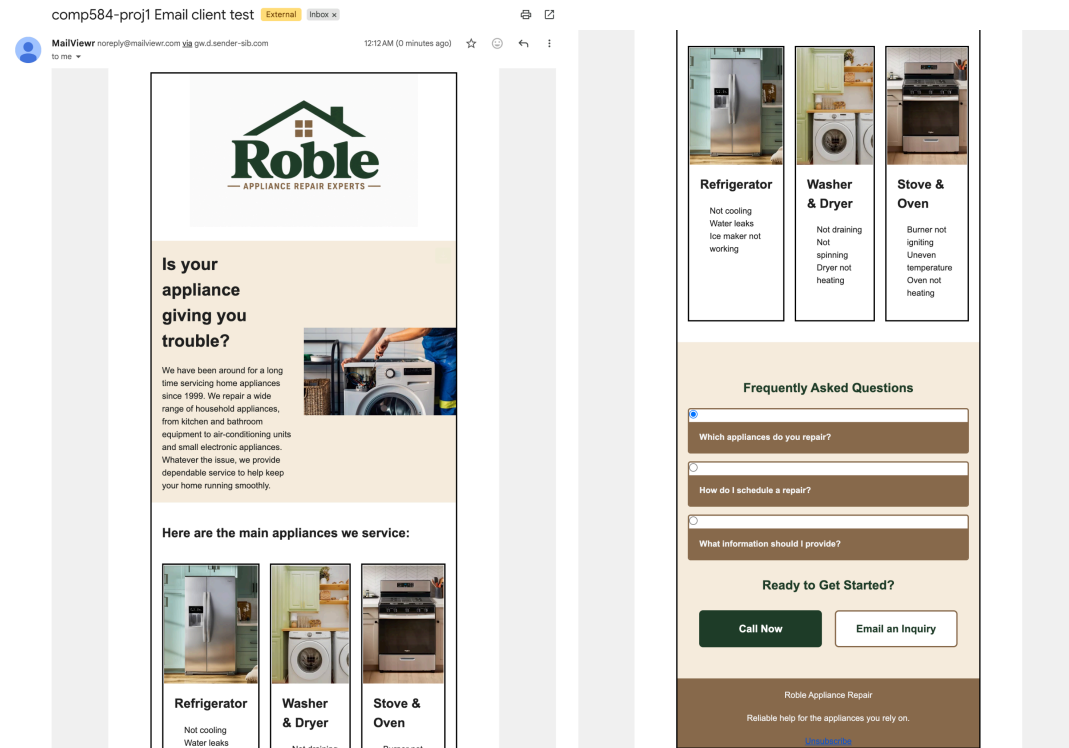

Clients Tested: Gmail Desktop, Gmail Mobile, and Apple Mail

3. Test Results

Client	Layout	Images	FAQ	Animation	Links
Gmail Desktop	Fail	pass	fail	fail	pass
Gmail Mobile	fail	pass	fail	fail	pass
Apple Mail	fail	fail	fail	fail	pass

4. Screenshots and Observations

Gmail Desktop

Result: partial

Layout is as expected, however the overall width of the table is fixed when it shouldn't be. Images load properly, and the links and buttons work as expected.

Here's what didn't work out:

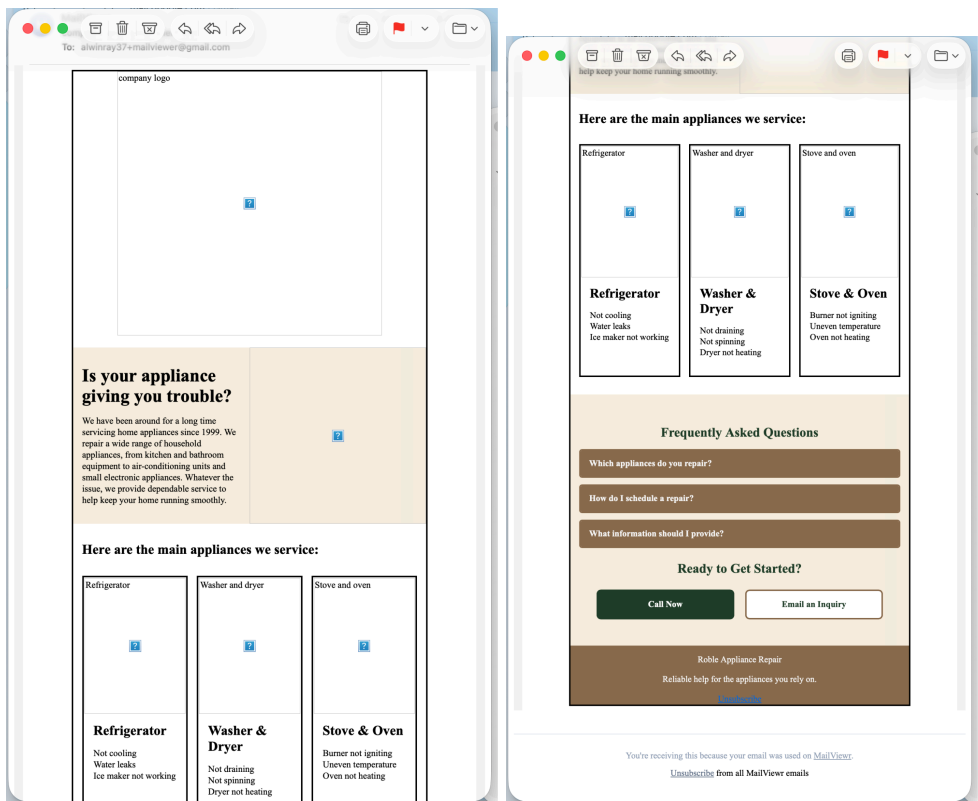

- Media query for smaller widths, should be dynamic, columns should stack
- FAQ radio buttons are clickable but does not function as expected

Gmail Mobile

Result: Partial

Similar to the desktop view above.

Apple Mail

Result: Fail

Images didn't load properly, columns didn't stack for smaller widths, animation doesn't show. The FAQ section looks better than gmail however it is not functional. CTA buttons work as expected.

5. Compatibility Findings

Most basic email features, including the layout, images, text, and contact links, worked correctly, aside from media query. It may be the email tool I used that stripped that css.

Some advanced features, such as the FAQ interaction and CSS animation, display differently and do not function as expected.

Main issue: The basic layout structure remained correct, there were no breaks in the ui, however the media query I set for small widths was not in effect.

6. Conclusion

The email was tested across multiple email clients and devices. Overall, the email remained readable, but not functional besides the CTA buttons. Some CSS features may not work in every email client, but the important content and contact links remained available.

I suspect that the majority of my css issues stemmed from the email tool I used to test, I only had a day to really play around with it, maybe if I had more time I can tweak my html to fit the standards of an email campaign. I tested the index.html file with vsCode's liveview and it works as expected.
